

Scientific Visualization

Leif Kobbelt

Overview

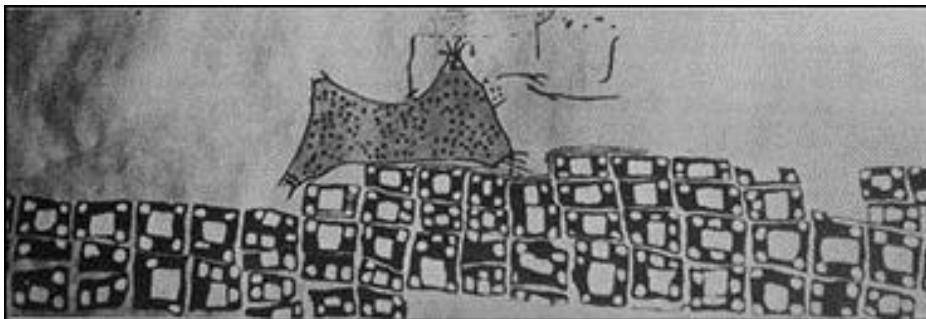

- introduction to visualization
- mapping & rendering
- data cleanup & filtering
- data structures & implementation

History

Map of Catal Hyük
6200 BC

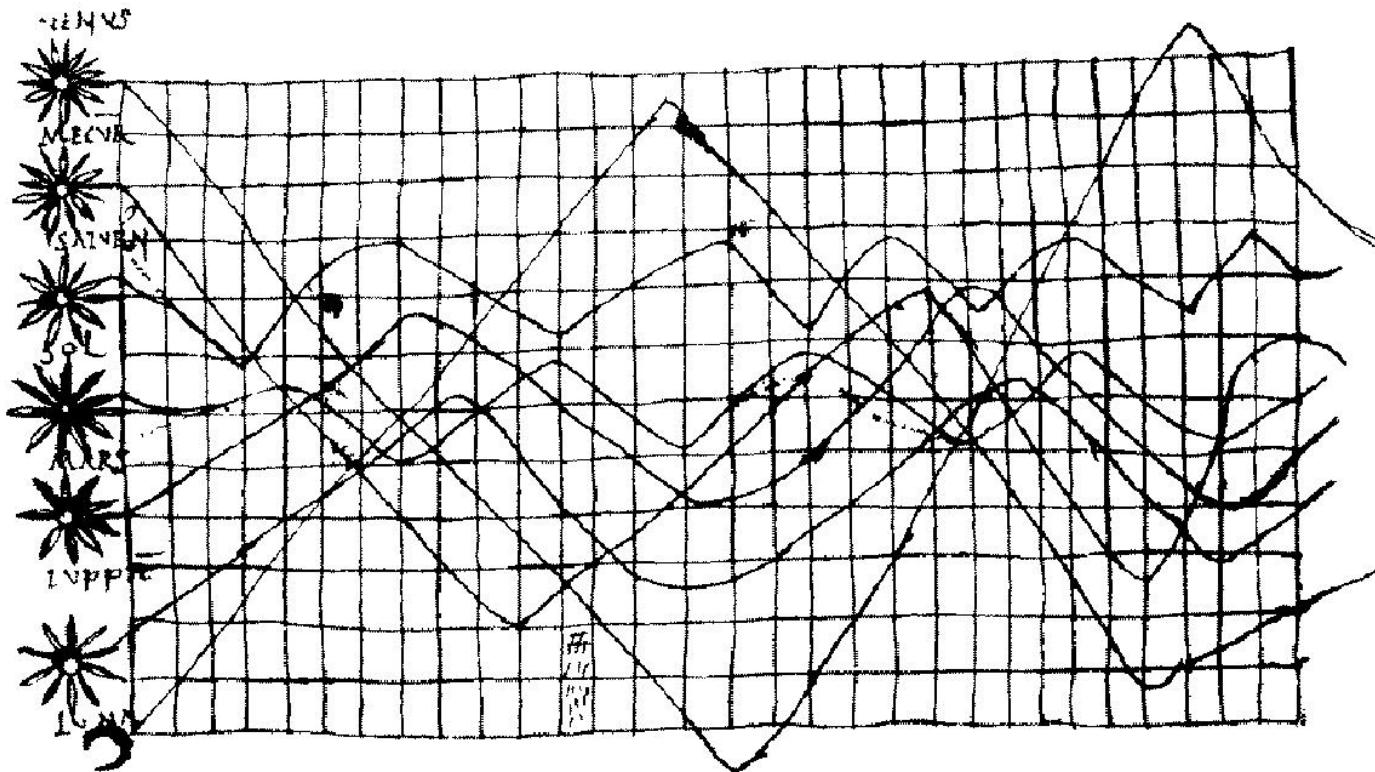

Excavation

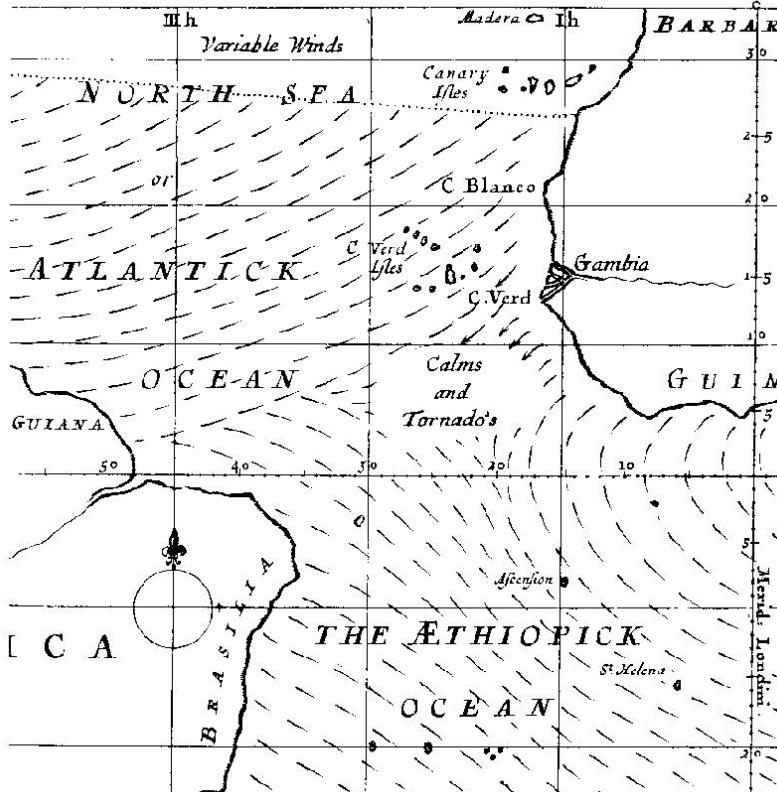

Reconstruction

History

- Time series: inclination of planets
(10th century)

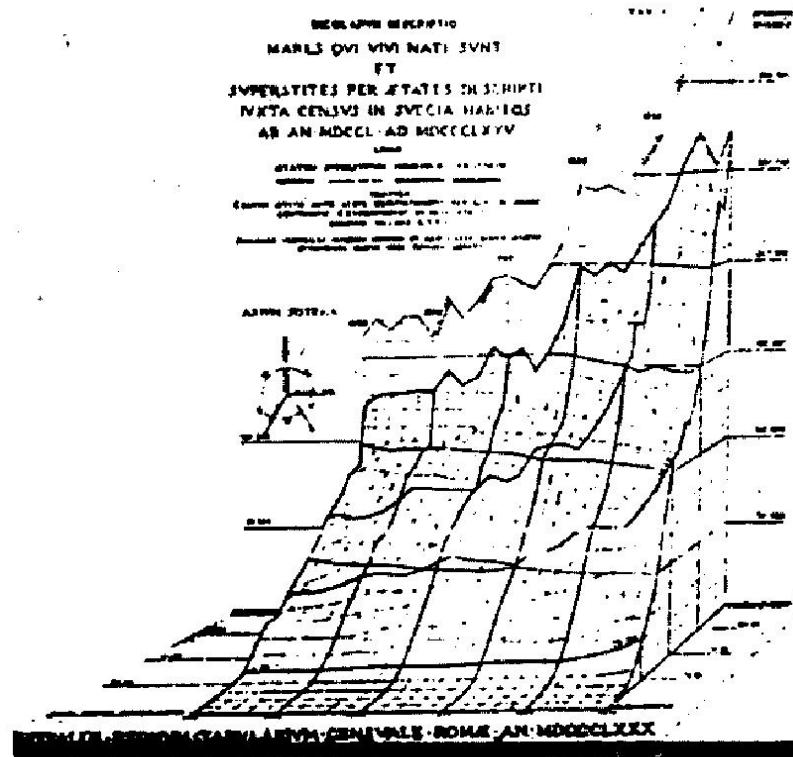

History

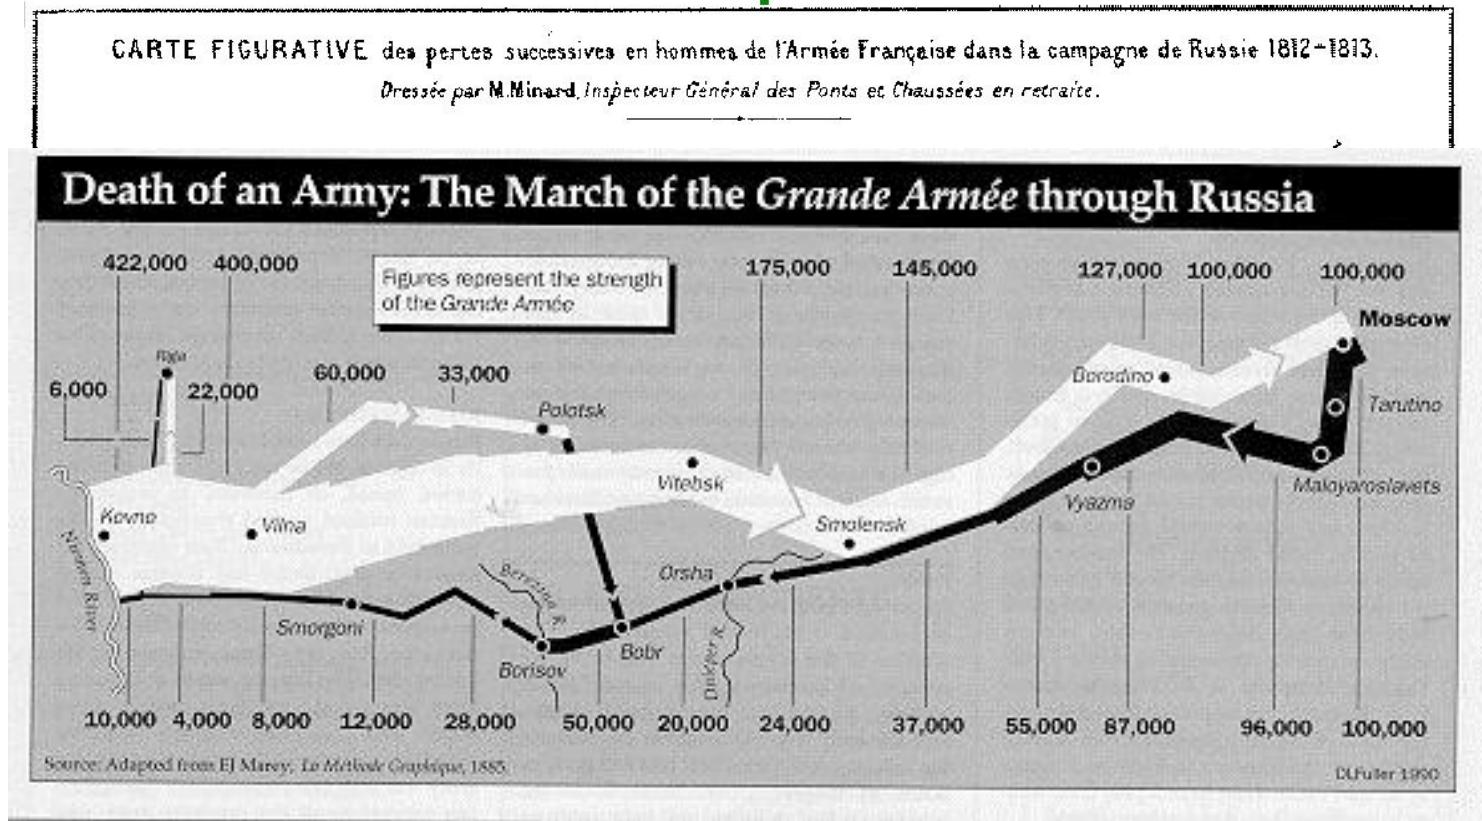

Vector visualization (1686)

5

Height field (1879)

History

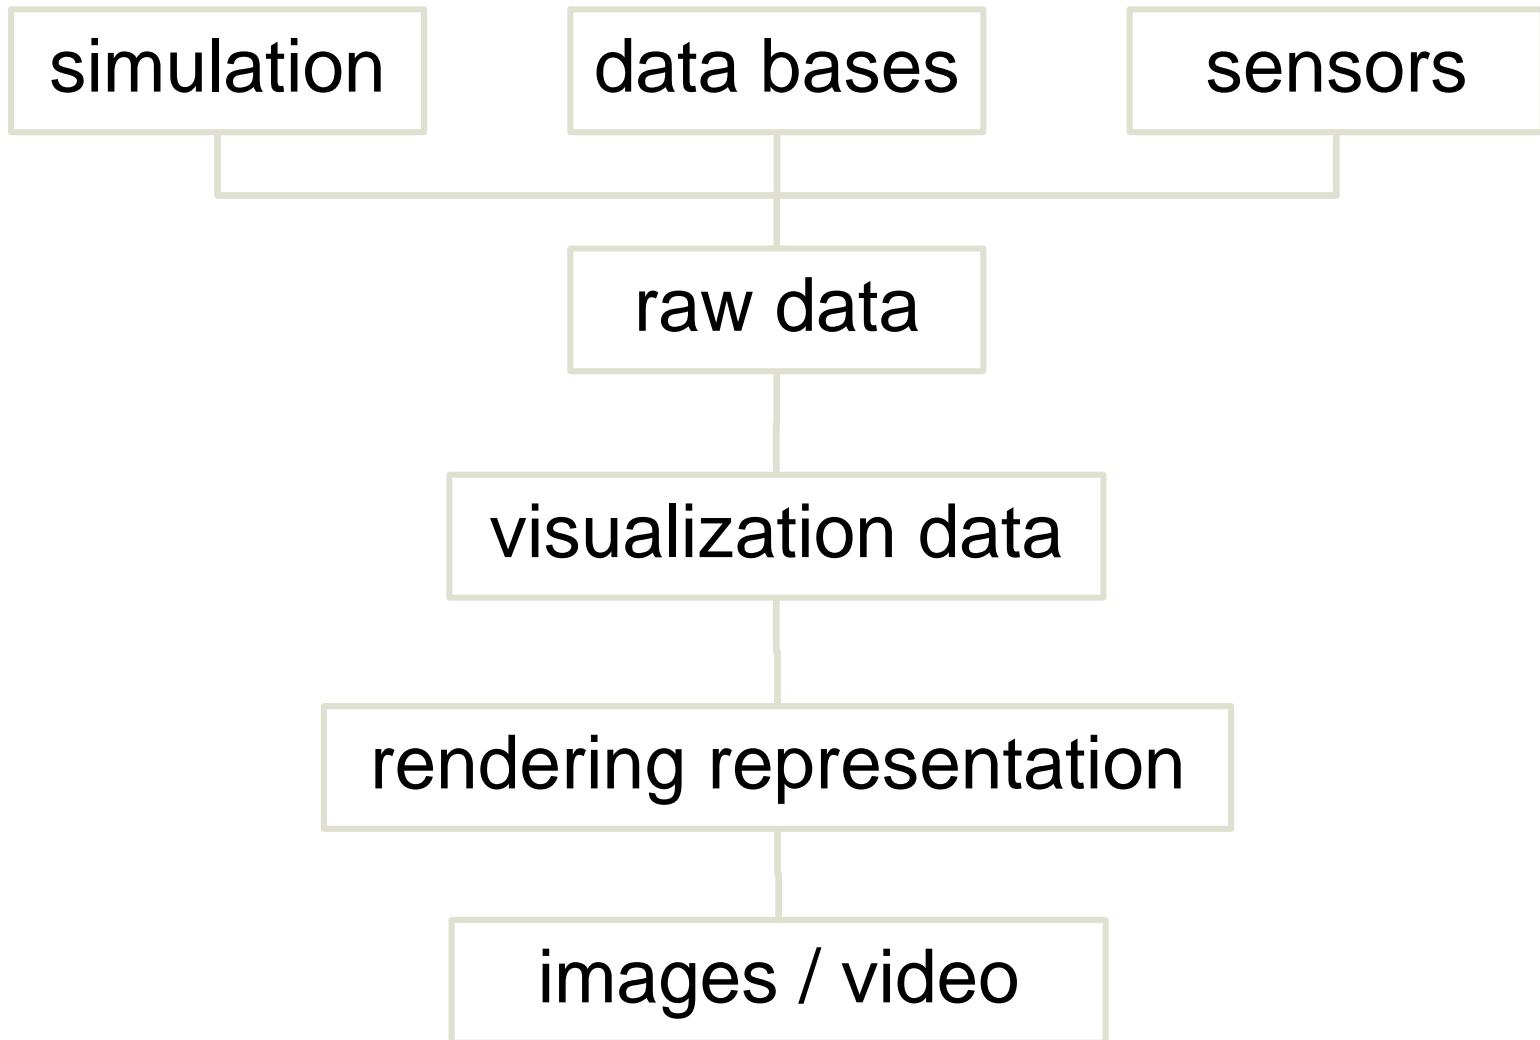

Napoleon's campaign against Russia (1812/13)
Cartography (1861)

“The purpose of computing
is insight not numbers”

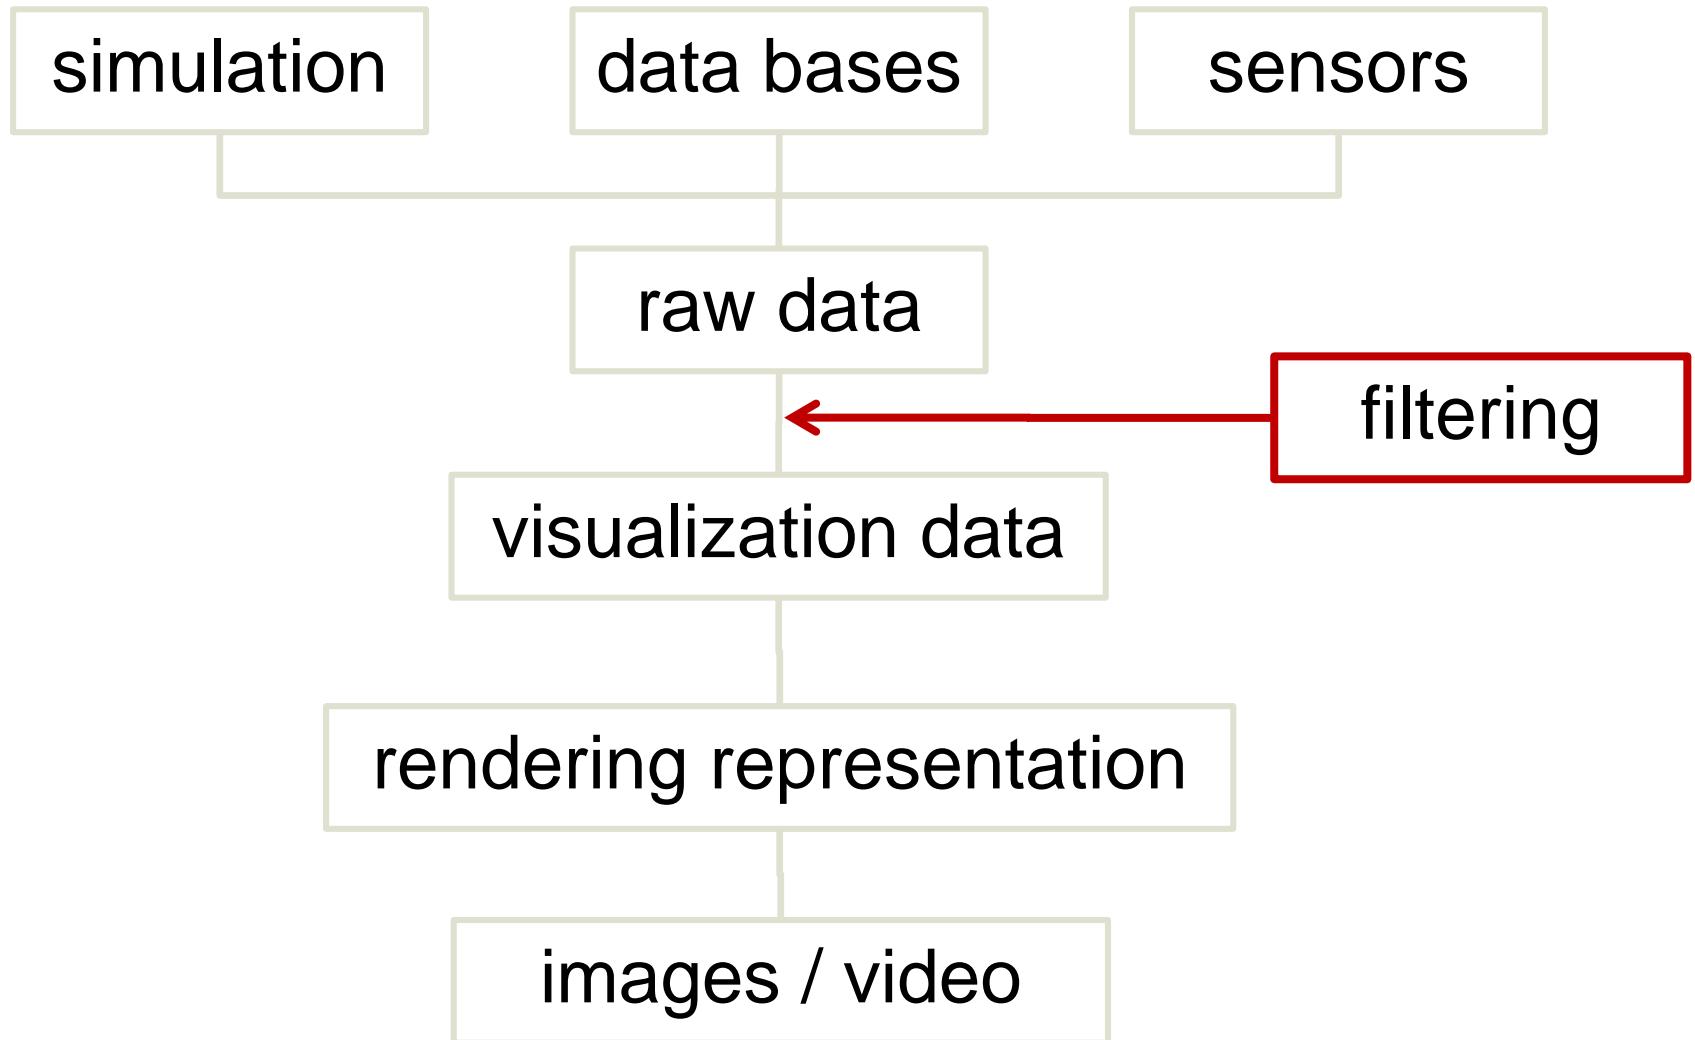

(Hamming 1962)

- **direct implications**
 - the data flood from super computer simulations can only be dealt with visually
 - needs a visualization specialist and an interdisciplinary team
 - new developments in hard/software, nets, etc are necessary
- **advantages in the long term will be**
 - faster insight
 - faster product–development cycles
 - stronger position in global competition

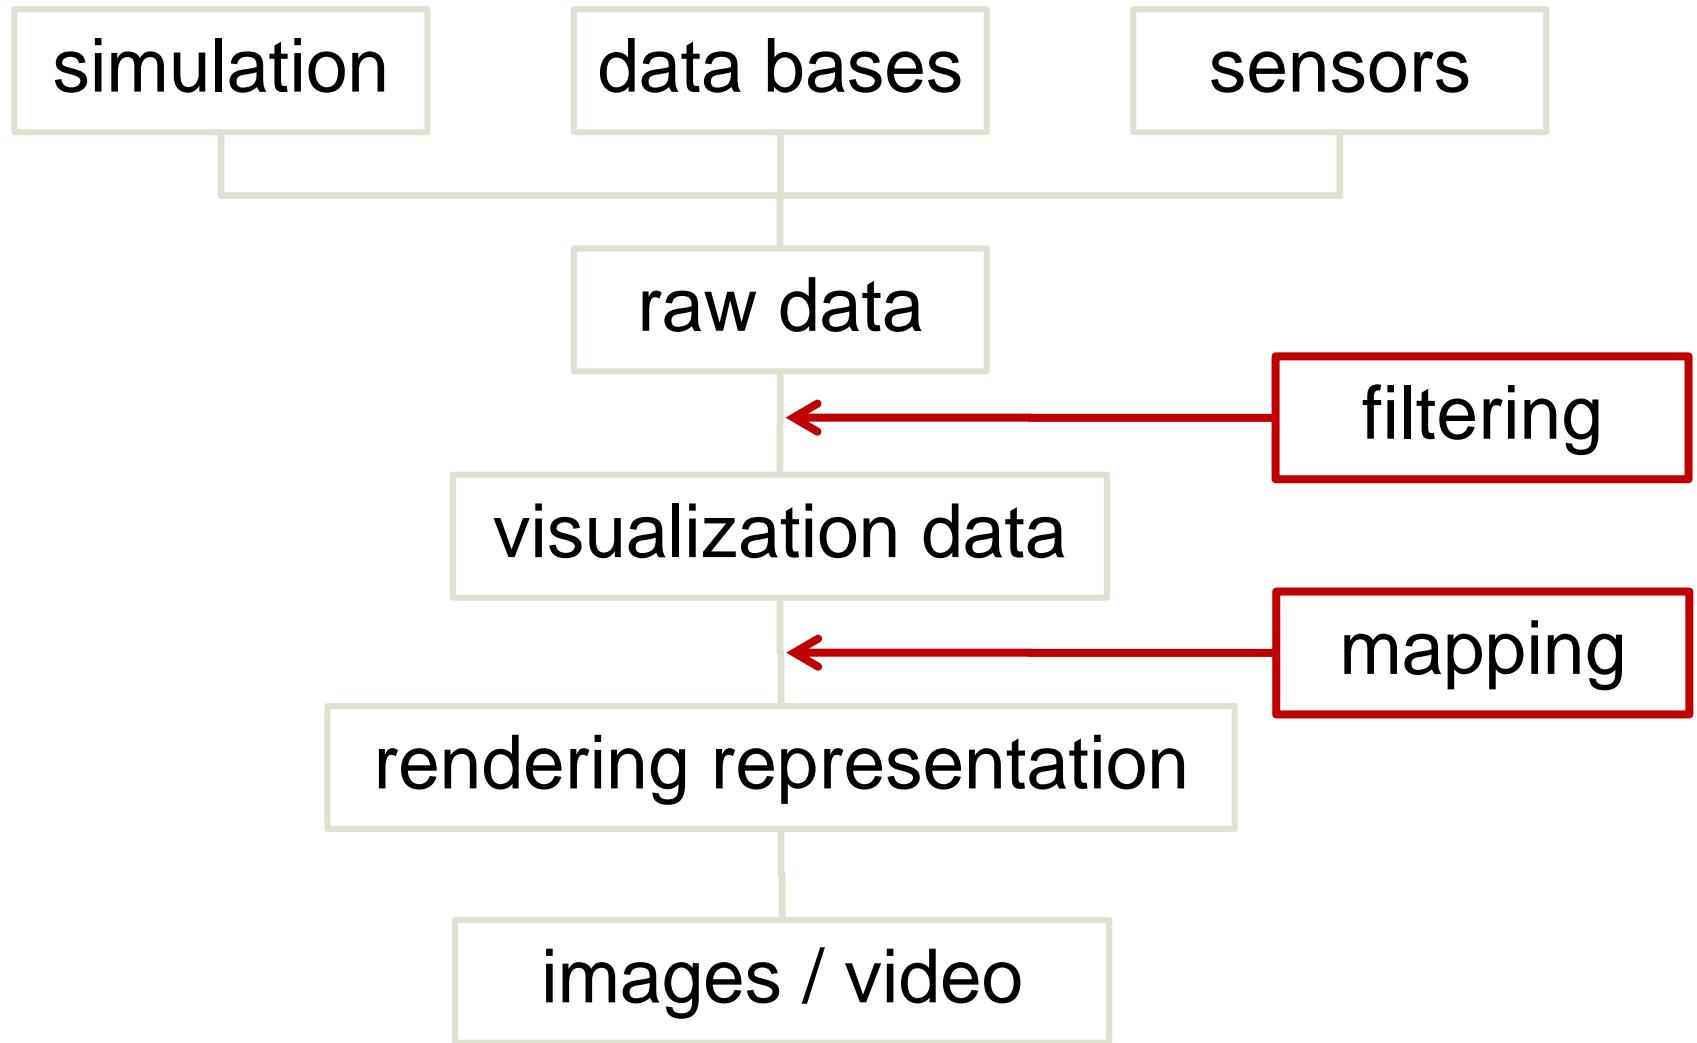

The Visualization Pipeline

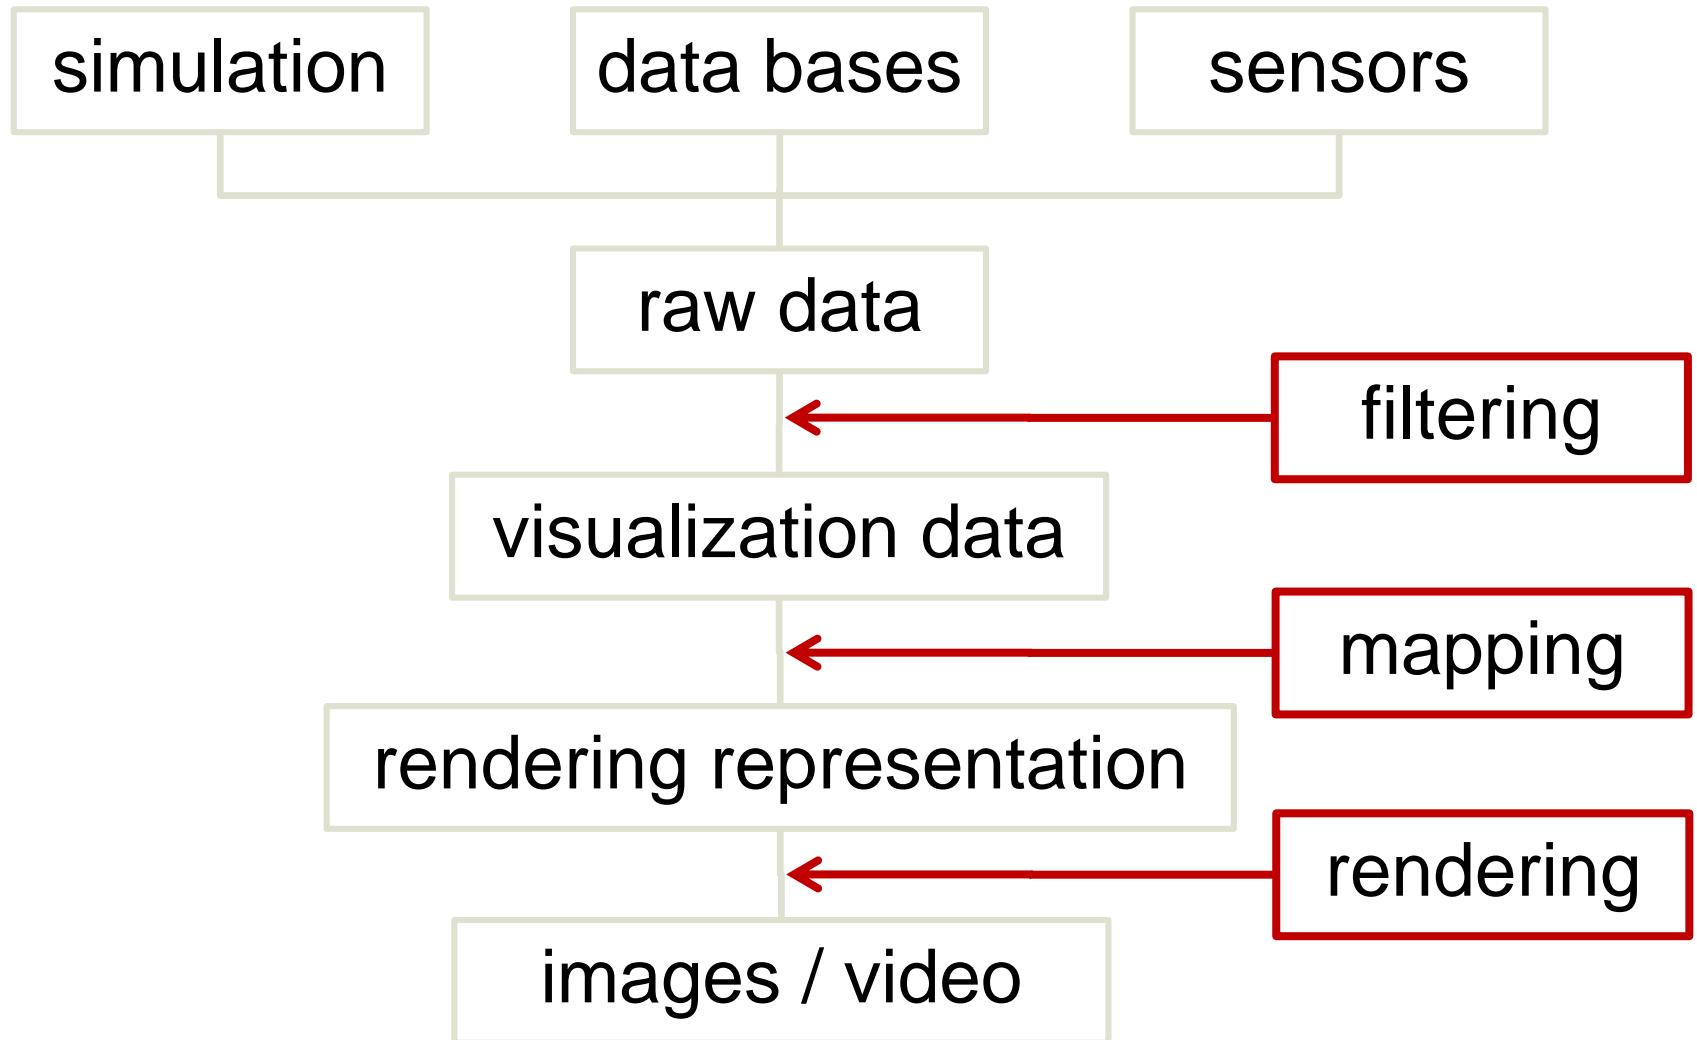

The Visualization Pipeline

The Visualization Pipeline

The Visualization Pipeline

Filtering

- data format conversion
- clipping / cropping
- denoising
- sub- / super- / re-sampling
- interpolation / approximation
- classification / segmentation

Mapping

- graphics primitives
 - points, lines, surfaces, volumes
 - polynomials vs. piecewise linear
 - color, texture, transparency
- iso-contours of scalar fields
- height fields
- vectors, glyphs, ...

- geometric scenes
 - surfaces, volumes, images
- intuition
 - perspective, visibility
- realism
 - shadows, lighting, reflections

Reliability

- errors in ...
 - data acquisition
 - filtering
 - mapping / interpolation
 - rendering

Reliability

- errors in ...
 - data acquisition
 - sampling density → alias
 - quantization
 - filtering
 - mapping / interpolation
 - rendering

Reliability

- errors in ...
 - data acquisition
 - filtering
 - noise to signal ratio
 - features
 - mapping / interpolation
 - rendering

Reliability

- errors in ...
 - data acquisition
 - filtering
 - mapping / interpolation
 - approximation quality
 - intuition (plausible real world analogue)
 - rendering

Reliability

- errors in ...
 - data acquisition
 - filtering
 - mapping / interpolation
 - rendering
 - consider human perception
 - avoid distraction (too much information)
 - too much realism (pseudo information)

Types of Data

- domain
- range

$$f : R^d \mapsto R^n$$

Types of Data

- domain
 - univariate
 - bivariate
 - trivariate / „volumes“ (d=3)
 - quadvariate / e.g. „space-time volumes“ (d=4)
- range dimension

Types of Data

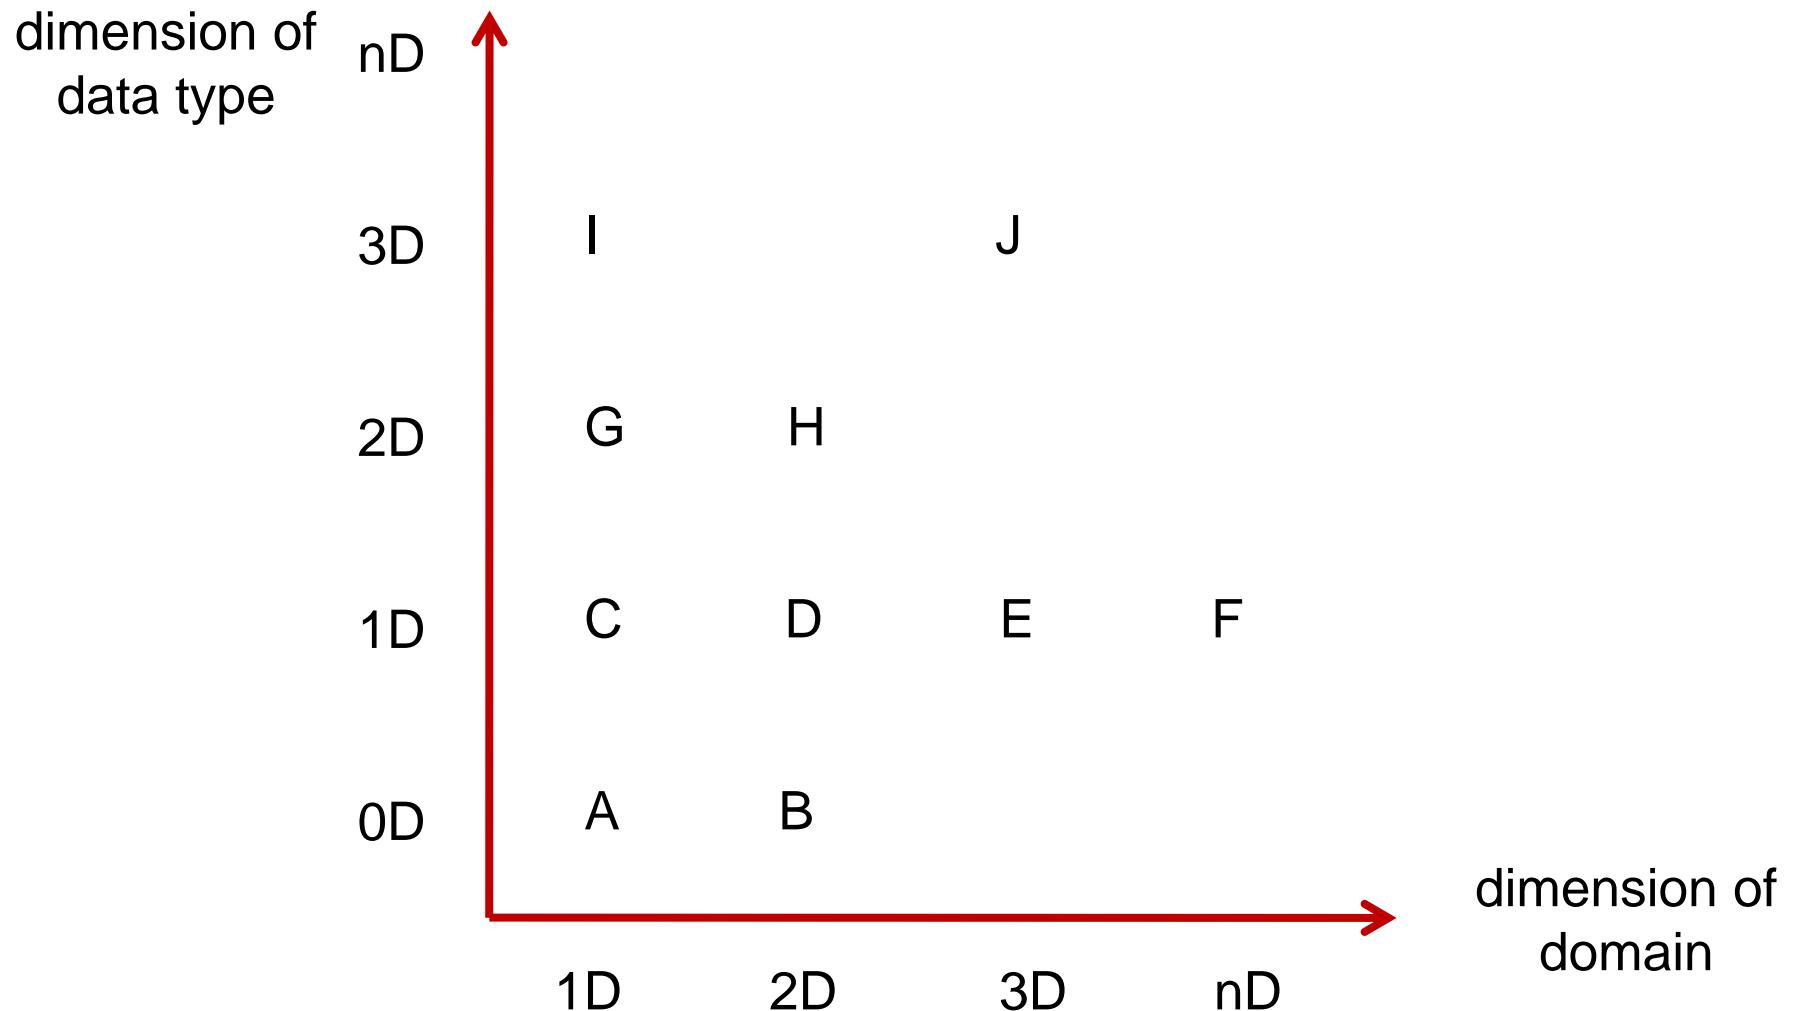

- domain
- range
 - scalar
 - planar ($n=2$)
 - spatial ($n=3$)
 - multi-dimensional

$$f : R^d \mapsto R^n$$

}

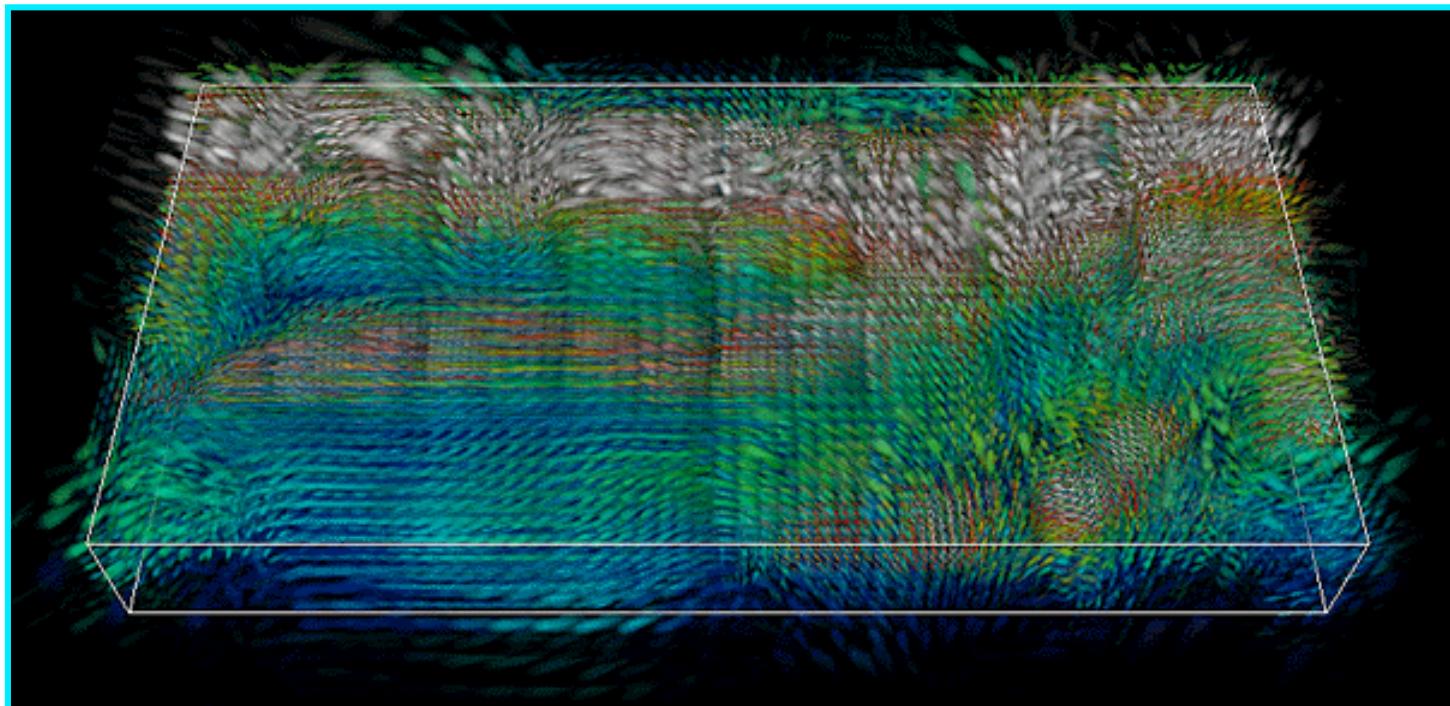

vector valued

Types of Data

Applications

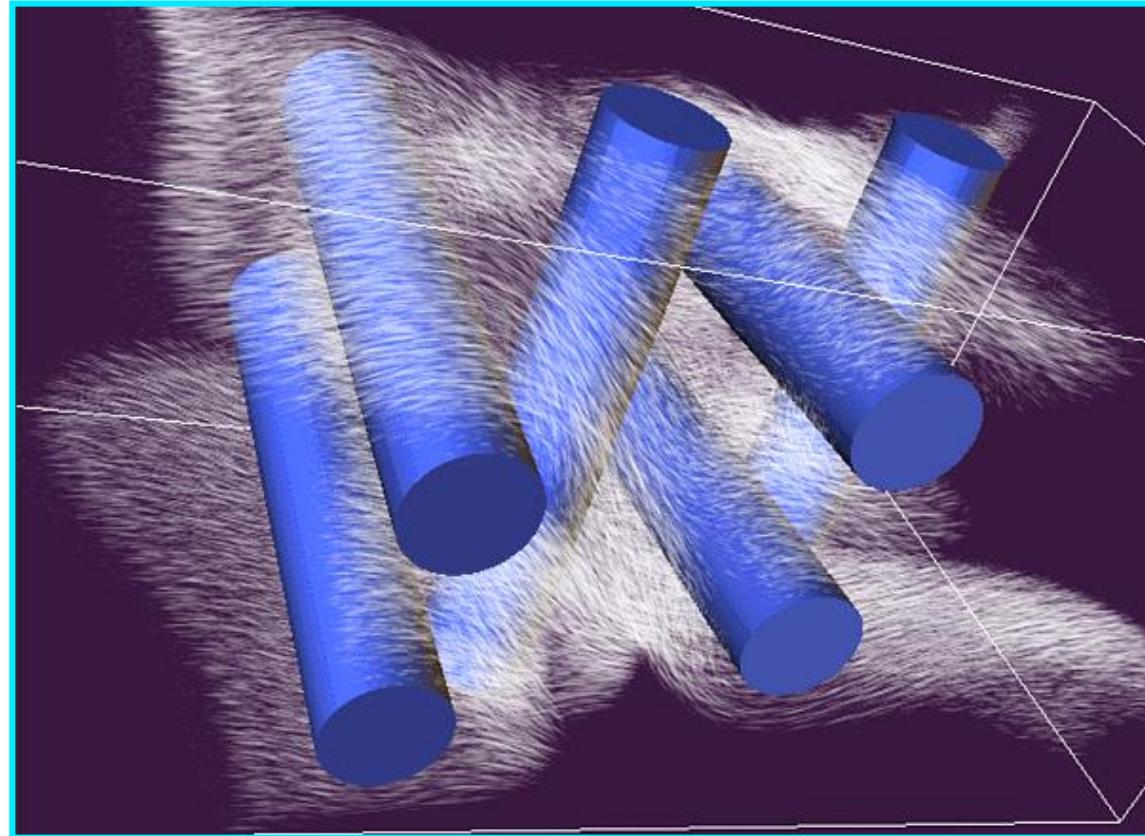

- Flow Visualization

© N. Max, LLNL

Applications

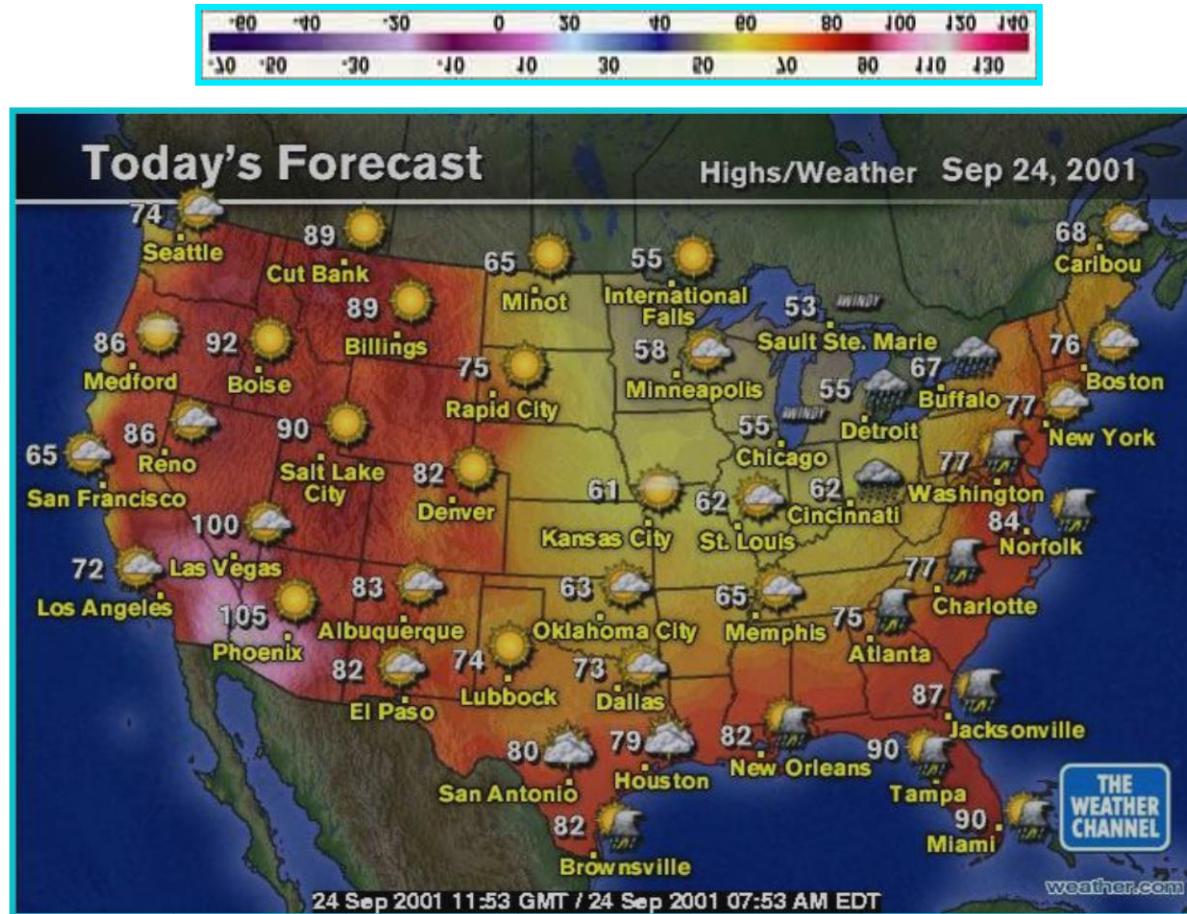

- Flow Visualization

© N. Max, LLNL

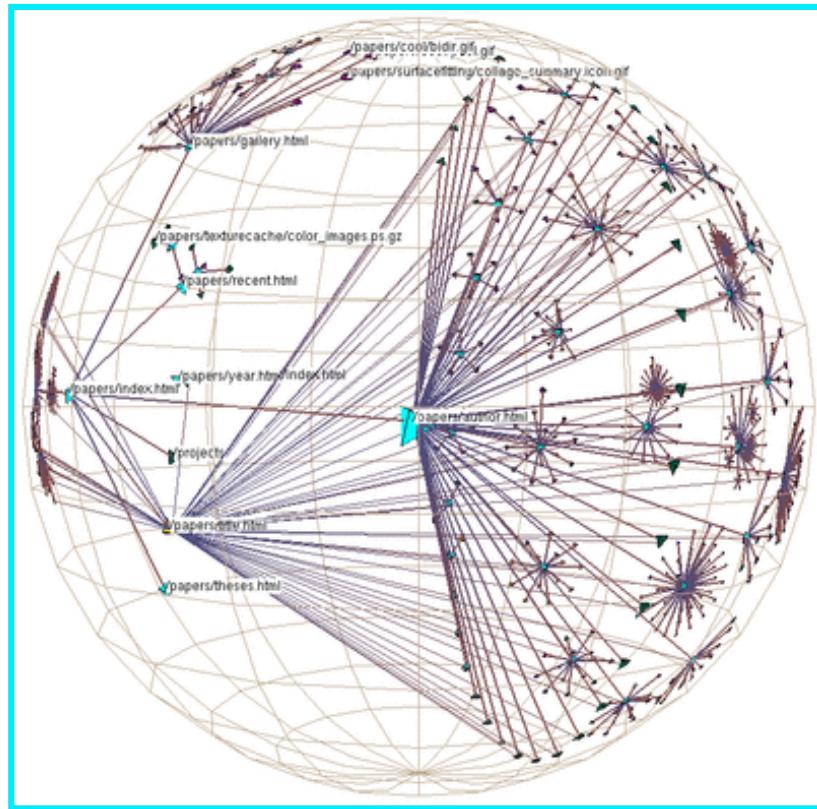

Applications

- Information Visualization

Applications

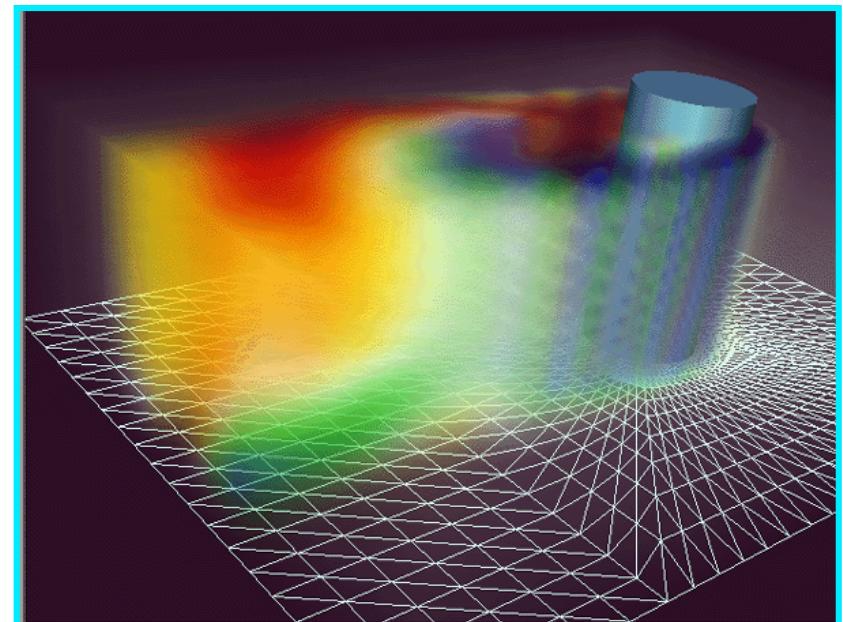

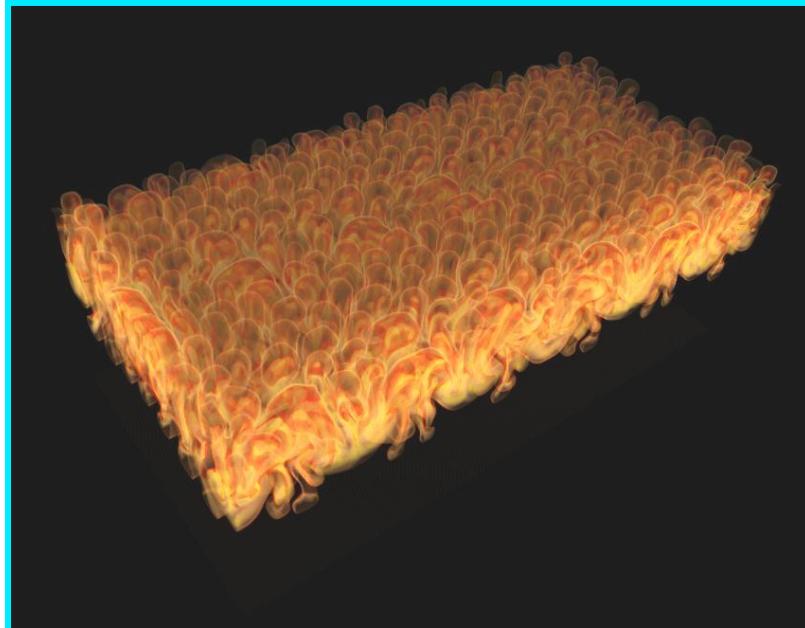

- Information Visualization

Web hyperlinks
(quasi-hierarchical
graphs)

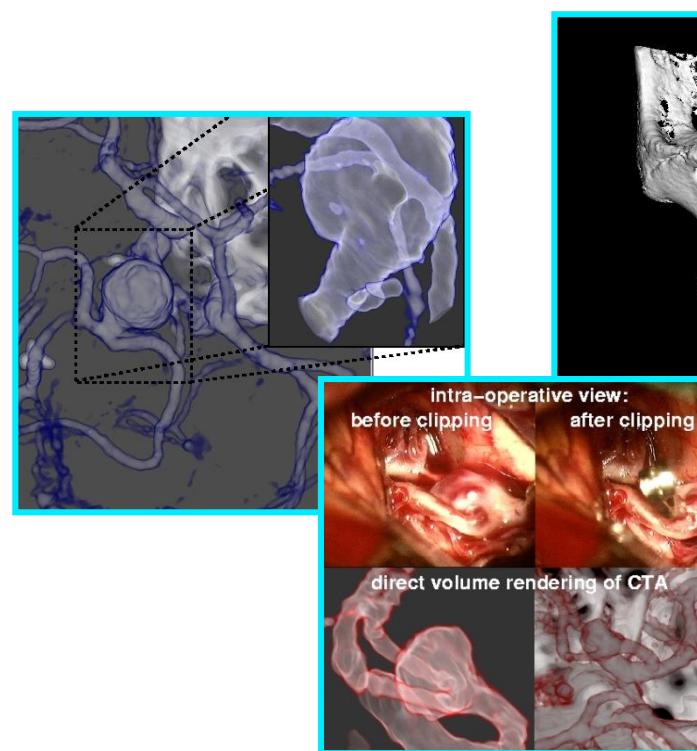

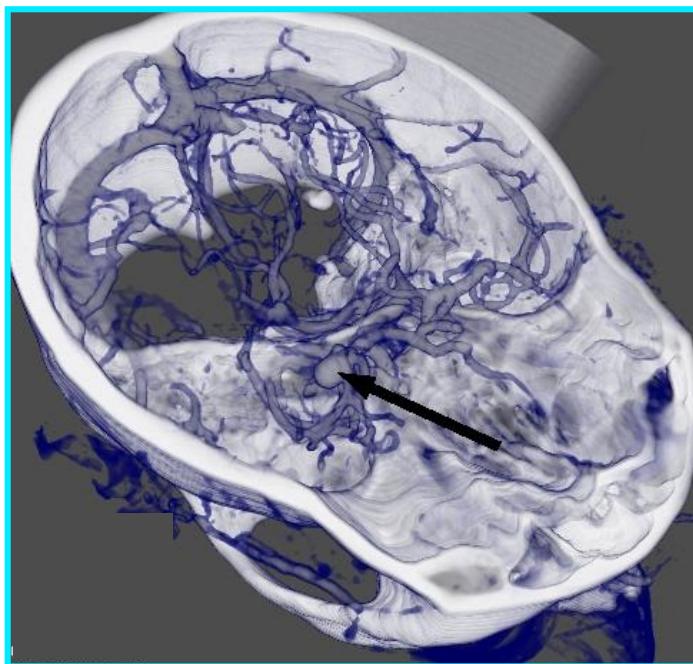

Volume Visualization

- Visualization of numerical simulation results
 - large and unstructured data sets

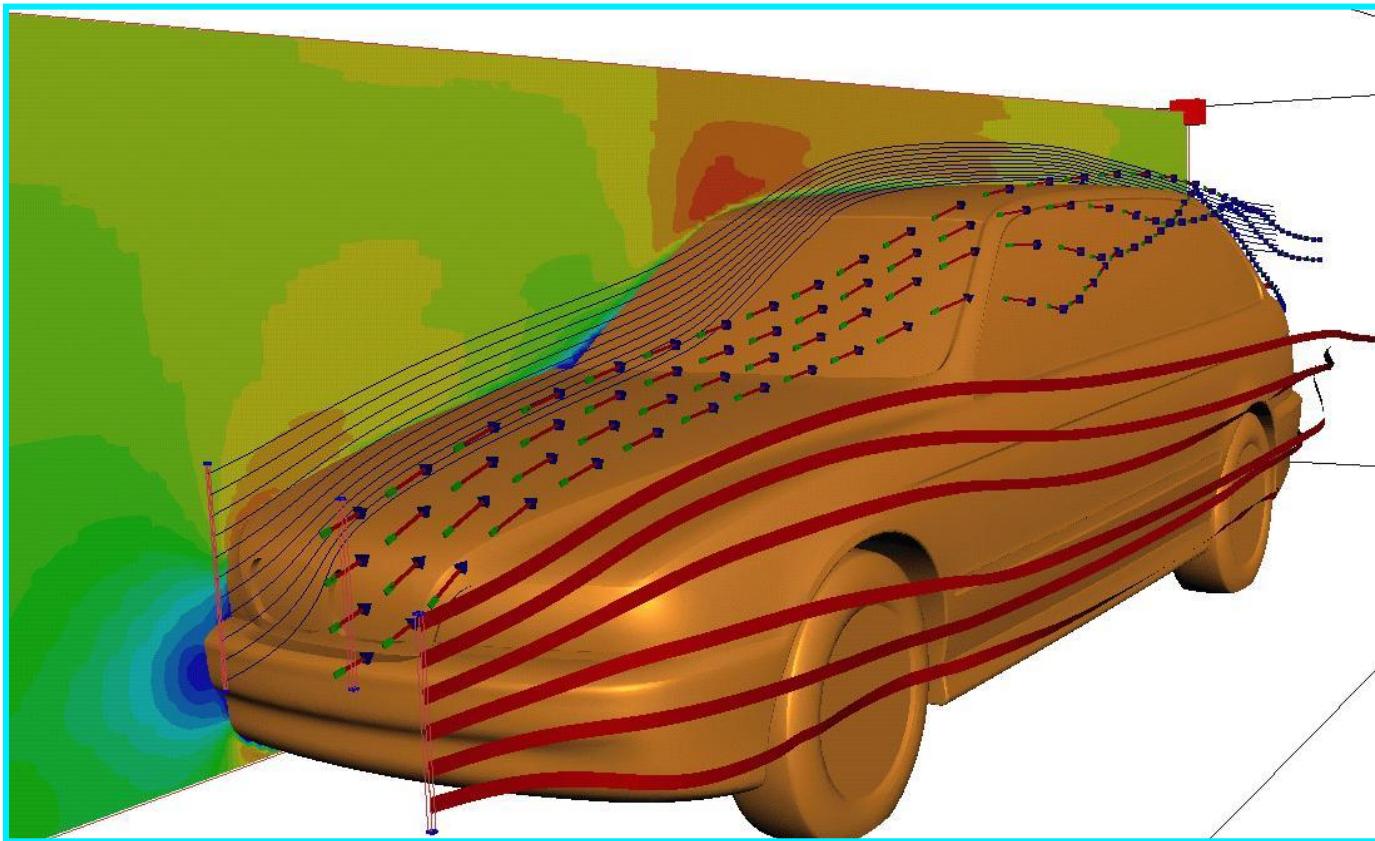

Volume Visualization

- Visualization of medical data sets
 - analysis and pre-operative planning

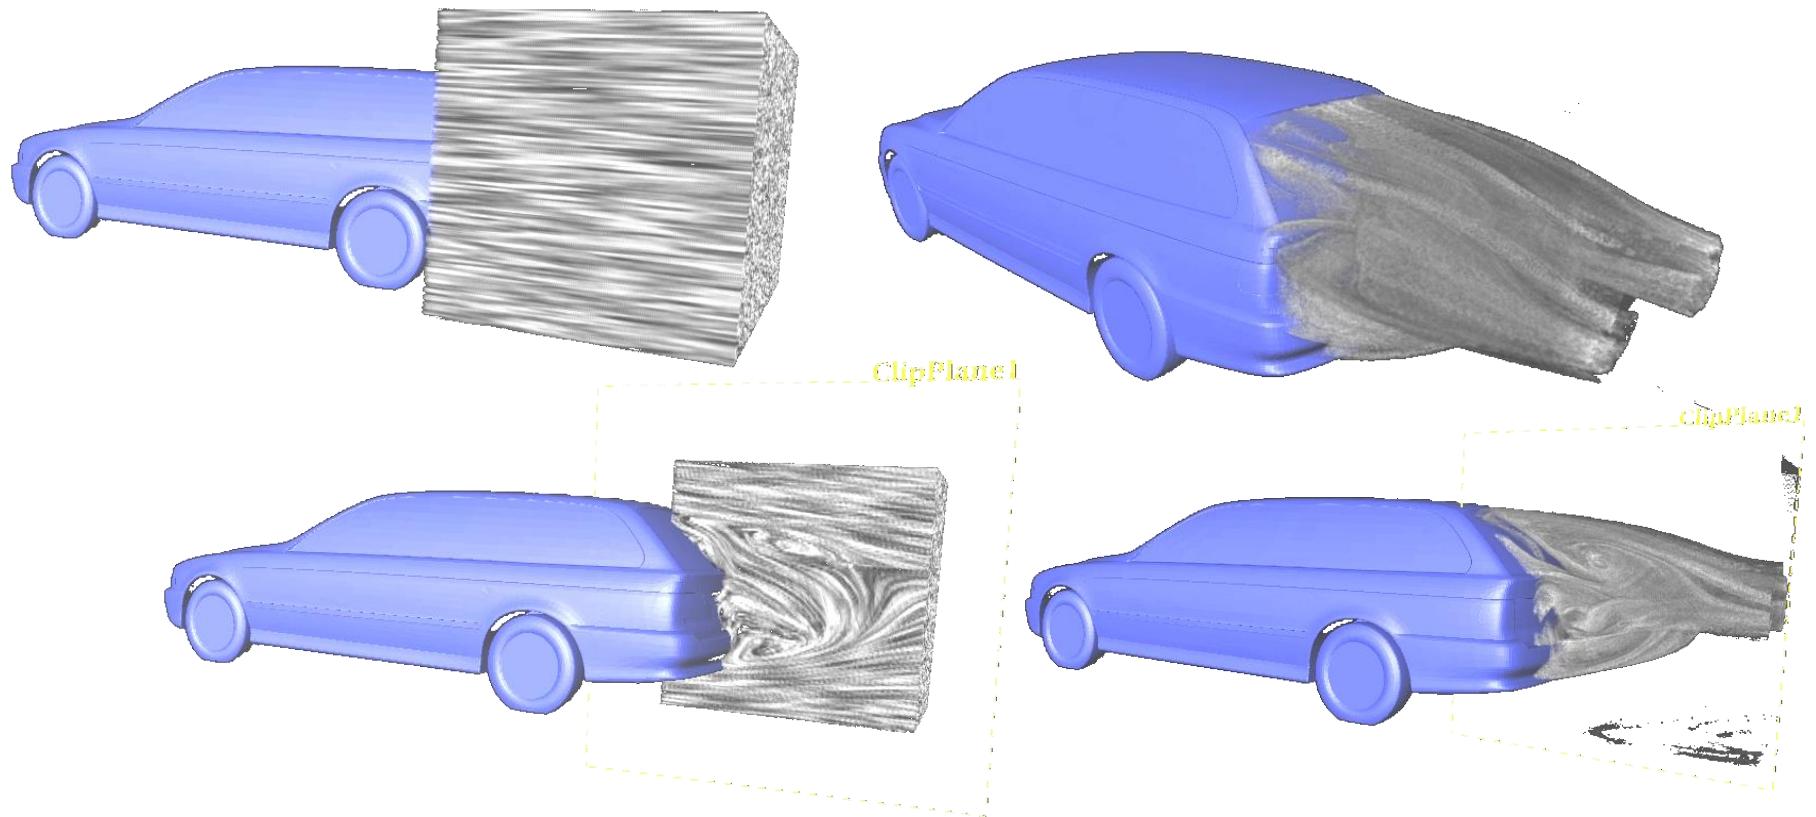

Vector Field Visualization

- Visualization of flow phenomena

Vector Field Visualization

- Feature extraction

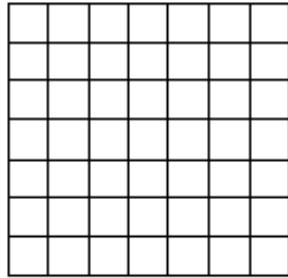

Grids

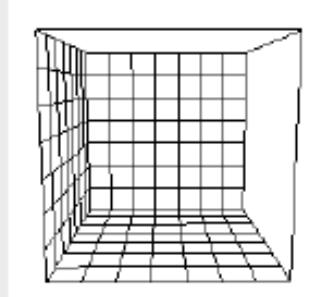

Data Structures

- domain structure
 - regular / grid
 - semi-regular (piecewise regular)
 - unstructured / scattered
- topology vs. geometry
 - linear, rectilinear, curvilinear
 - multigrids
 - sparse grids

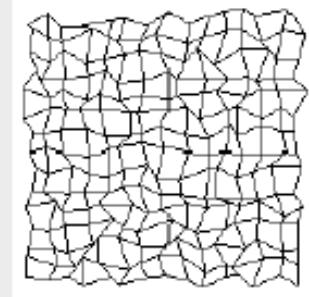

Data Structures

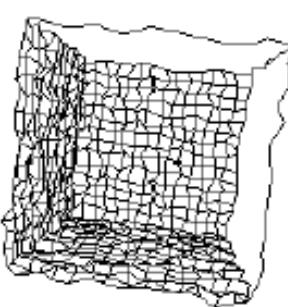

2D-Regular Grid

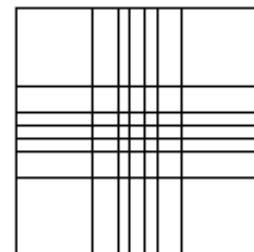

3D-Regular Grid

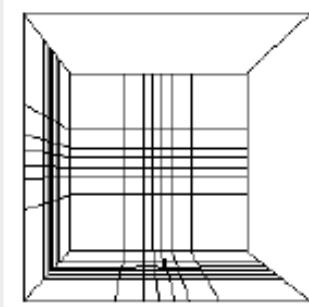

2D-Irregular Grid

3D-Irregular Grid

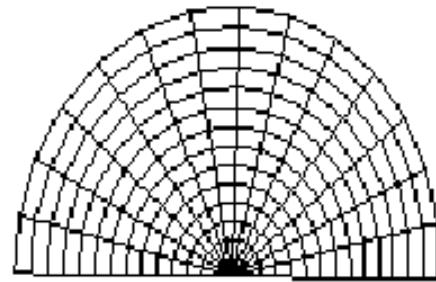

2D-Block-Structured Grid

3D-Block-Structured Grid

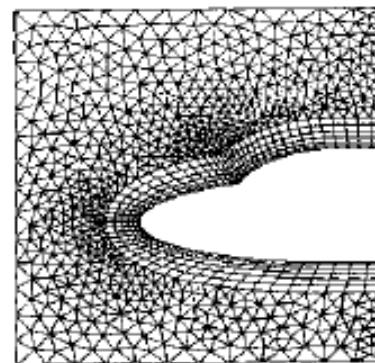

Data Structures

Volumetric Representations

- Voxel grid → $O(h^{-3})$
- Adaptive octree
 - Three color octree → $O(h^{-2})$
 - Adaptively sampled distance fields → $O(h^{-1})$
- kD-Tree
- Binary space partition
 - Partition the space along arbitrary planes
 - Piecewise **linear** C^{-1} approximation
 - Align cells to surface

Color Coding

Color Coding

- Issues:
 - What kind of data can be color-coded ?
 - What kind of information can be efficiently visualized?
- Areas of application
 - Provide information coding
 - Designate or emphasize a specific target in a crowded display
 - Provide a sense of realism or virtual realism
 - Provide warning signals or signify low probability events
 - Group, categorize, and chunk information
 - Convey emotional content
 - Provide an aesthetically pleasing display

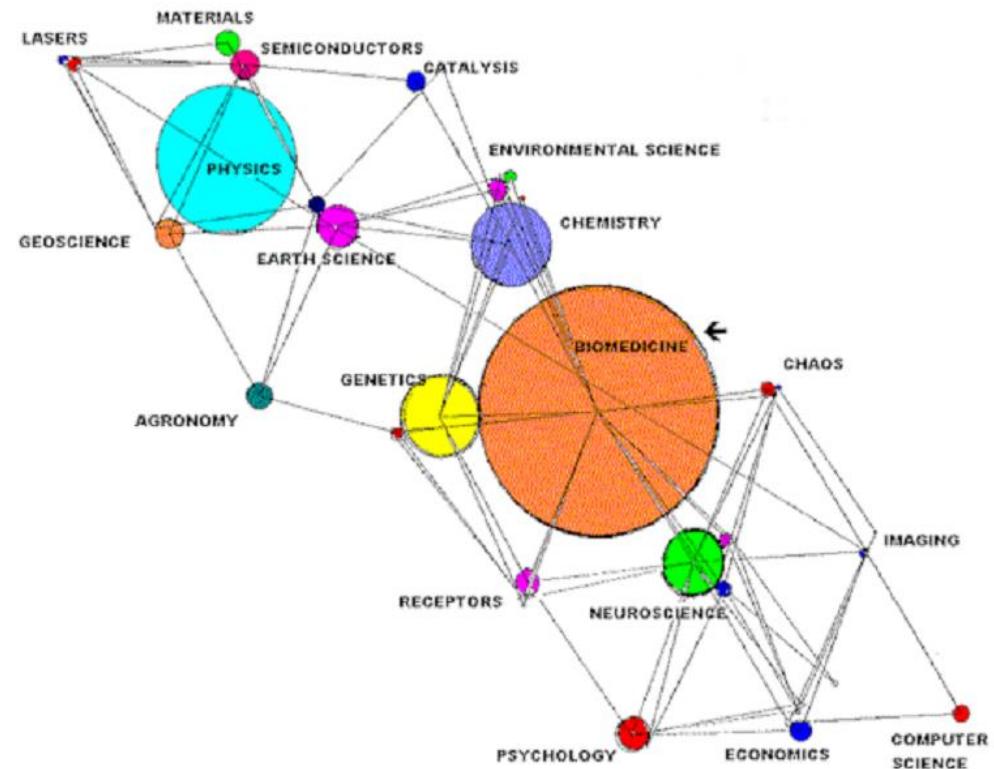

Color Coding

- Possible problems:
 - Distracts the user when inadequately used
 - Dependent on viewing and stimulus conditions
 - Ineffective for color deficient individuals
 - Results in information overload
 - Unintentional conflicts with cultural conventions
 - Cause unintended visual effects and discomfort

Color Coding

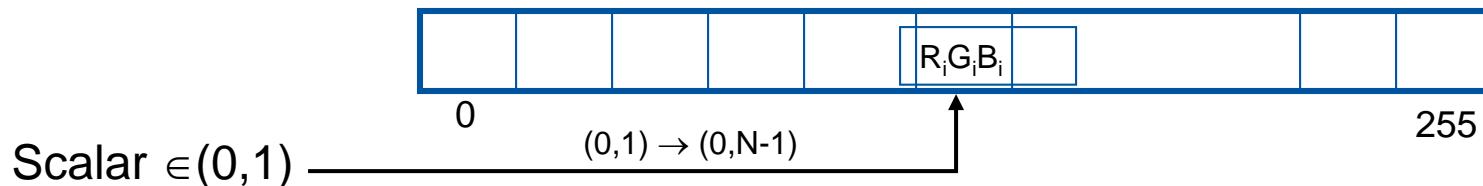

- Nominal data
 - Colors need to be distinguished
 - Localization of data
 - Around 8 different basis colors

co-citation analysis

Color Coding

- Ordinal and quantitative data
 - Ordering of data should be represented by ordering of colors
 - Psychological aspects
 - $x_1 < x_2 < \dots < x_n \rightarrow E(c_1) < E(c_2) < \dots < E(c_n)$
- Color coding for scalar data
 - Assign to each scalar value a different color value
 - Assignment via transfer function T
 $T : \text{scalarvalue} \rightarrow \text{colorvalue}$
 - Code color values into a color lookup table

Color Coding

- Pre-shading vs. post-shading
 - Pre-shading
 - Assign color values to original function values (e.g. at vertices of a cell)
 - Interpolate between color values (within a cell)
 - Post-shading
 - Interpolate between scalar values (within a cell)
 - Assign color values to interpolated scalar values
- Linear transfer function for color coding
 - Specify color for f_{min} and for f_{max}
 - $(R_{min}, G_{min}, B_{min})$ and $(R_{max}, G_{max}, B_{max})$
 - Linearly interpolate between them

$$f \mapsto \frac{f - f_{min}}{f_{max} - f_{min}} (R_{min}, G_{min}, B_{min}) + \frac{f_{max} - f}{f_{max} - f_{min}} (R_{max}, G_{max}, B_{max})$$

Color Coding

- Different color spaces lead to different interpolation functions
- In order to visualize (enhance/suppress) specific details, non-linear color lookup tables are needed
- Gray scale color table
 - Intuitive ordering
- Rainbow color table
 - Less intuitive
- Temperature color table

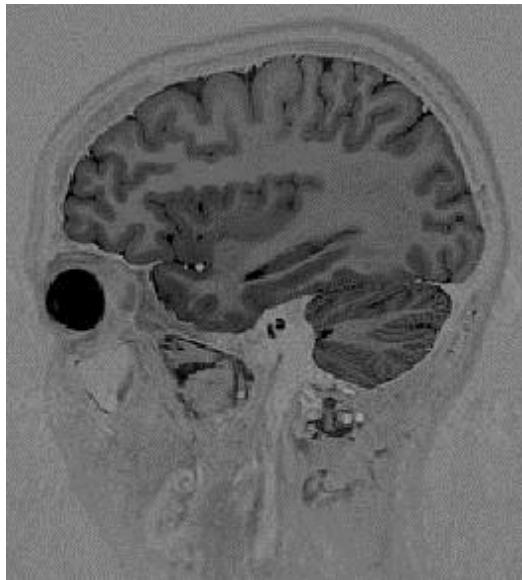

Color Coding

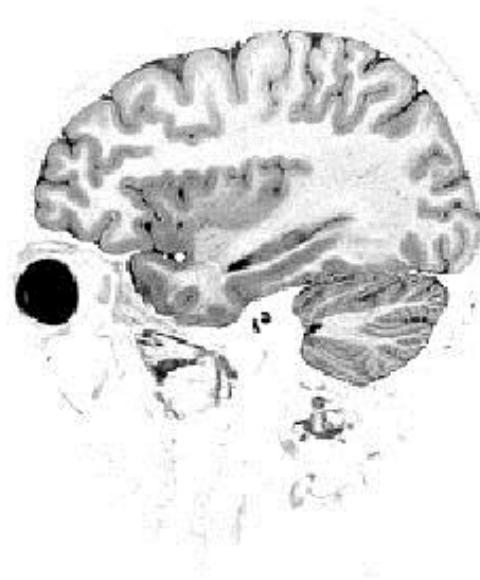

- Bivariate and trivariate color tables are not very useful:
 - No intuitive ordering
 - Colors hard to distinguish
- Many more color tables for specific applications
- Design of good color tables depends on psychological / perceptual issues
- Often interactive specification of transfer functions to extract important features

Color Coding

- Example
 - Special color table to visualize the brain tissue
 - Special color table to visualize the bone structure

Original

Brain

Tissue

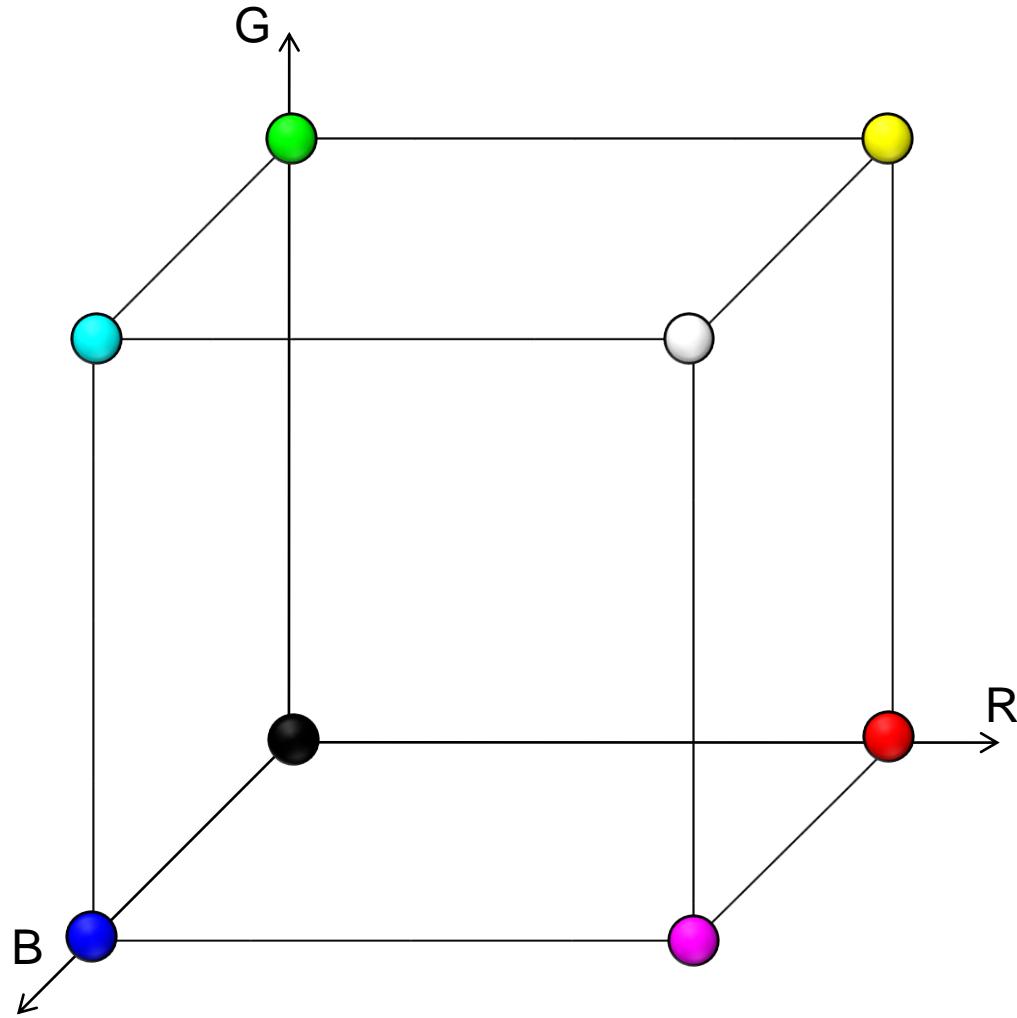

Color Quantization

- Task:
 - Select a set of colors to represent the color gamut of an image
 - Compute mapping from color space to representative color
- „True color“ image: 24 bits per pixel
- Colormap: 1 color index per pixel addresses color lookup table

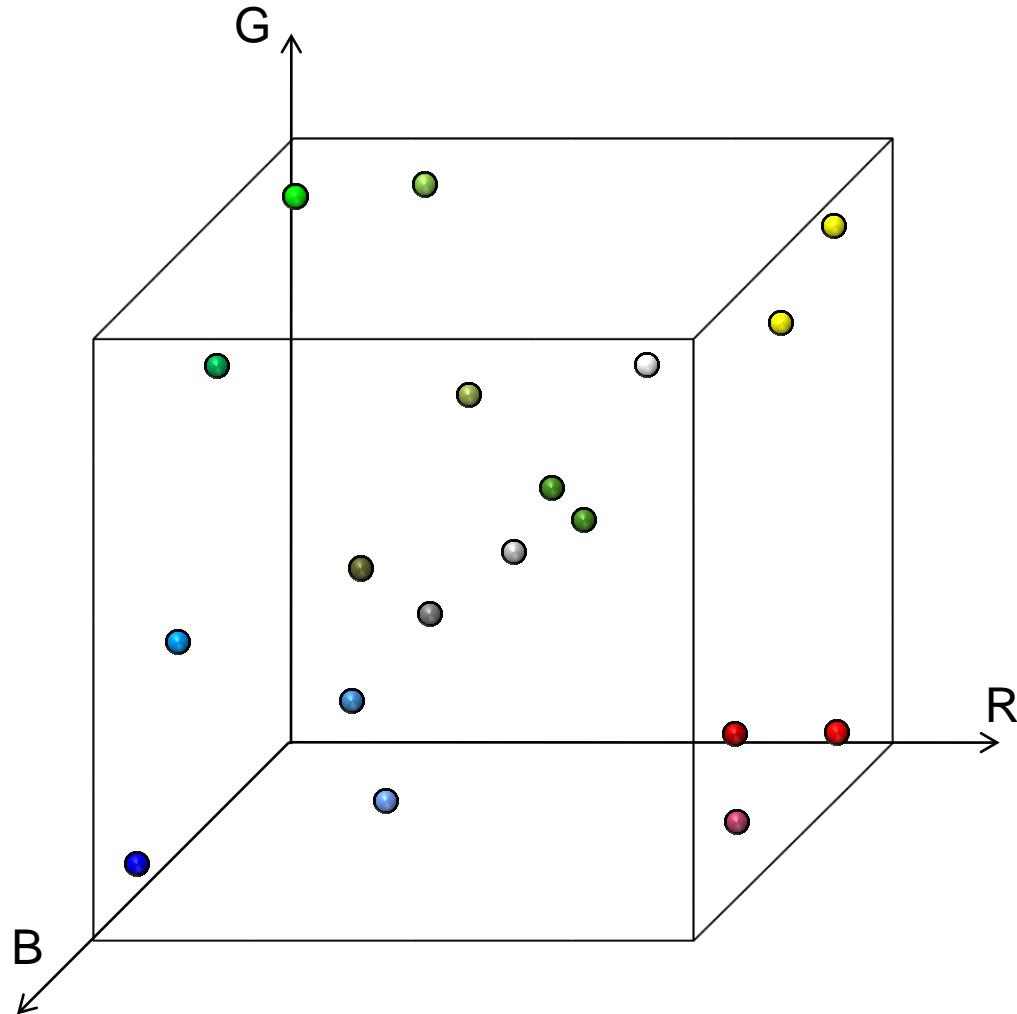

Color Quantization

- Naive idea: Uniform quantization
 - Drawback: many colors in colormap are not used in final image
➡ bad image reproduction
- Better: Median Cut Algorithm
 - Choose color map based on color distribution in original image
 - Pro: uses every color in the colormap
➡ closer image reproduction

Median Cut Algorithm

```
Color_Quantization(image I, k) {  
    for each pixel in I  
        map to RGB space  
    B = {RGB space}  
    for (i = 1 to k-1) {  
        L = Heaviest(B)  
        split L at median along longest dimension into L1 and L2  
        remove L from B and add L1, L2  
    }  
    for each box in B  
        assign color representative  
    for each pixel in I  
        map to representative  
}
```
